

ABSTRACT

A system and method for secure session management in a web farm using a session token. A session management web service updates the session token with each request
5 received from a browser. If the request must be redirected to a new server where the requested resource is located, then the decrypted session token is transmitted to the new server and the session management web service generates a new session token to be used in
10 place of the previous session token. The new session token is transmitted to the browser with the requested web resource.
